## Functional description

The AS7C256A is a 5.0V high-performance CMOS 262,144-bit Static Random-Access Memory (SRAM) device organized as 32,768 words  $\times$  8 bits. It is designed for memory applications requiring fast data access at low voltage, including Pentium™, PowerPC™, and portable computing. Alliance's advanced circuit design and process techniques permit 5.0V operation without sacrificing performance or operating margins.

The device enters *standby mode* when  $\overline{CE}$  is high. CMOS standby mode consumes  $\leq 11$  mW. Normal operation offers 75% power reduction after initial access, resulting in significant power savings during CPU idle, suspend, and stretch mode.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 10/12/15/20 ns with output enable access times ( $t_{OE}$ ) of 5, 6, 7, 8 ns are ideal for high-performance applications. The chip enable ( $\overline{CE}$ ) input permits easy memory expansion with multiple-bank memory organizations.

A write cycle is accomplished by asserting chip enable ( $\overline{CE}$ ) and write enable ( $\overline{WE}$ ) LOW. Data on the input pins I/O0-I/O7 is written on the rising edge of  $\overline{WE}$  (write cycle 1) or  $\overline{CE}$  (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{OE}$ ) or write enable ( $\overline{WE}$ ).

A read cycle is accomplished by asserting chip enable ( $\overline{CE}$ ) and output enable ( $\overline{OE}$ ) LOW, with write enable ( $\overline{WE}$ ) high. The chip drives I/O pins with the data word referenced by the input address. When chip enable or output enable is high, or write enable is low, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible. Operation is from a single 5.0  $\pm$ 0.5V supply. The AS7C256A is packaged in high volume industry standard packages.

## Notes

- 1 During  $V_{CC}$  power-up, a pull-up resistor to  $V_{CC}$  on  $\overline{CE}$  is required to meet  $I_{SB}$  specification.
- 2 For test conditions, see *AC Test Conditions*, Figures A, B.
- 3 These parameters are specified with  $C_L = 5\text{pF}$ , as in Figures B. Transition is measured  $\pm 500\text{mV}$  from steady-state voltage.
- 4 This parameter is guaranteed, but not tested.
- 5  $\overline{WE}$  is High for read cycle.
- 6  $\overline{CE}$  and  $\overline{OE}$  are Low for read cycle.
- 7 Address valid prior to or coincident with  $\overline{CE}$  transition Low.
- 8 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 9 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 10  $C=30\text{pF}$ , except on High Z and Low Z parameters, where  $C=5\text{pF}$ .
