

MAX32625/MAX32626 Evaluation Kits

Evaluate: MAX32625, MAX32626

General Description

The MAX32625/MAX32626 evaluation kit (EV kit) provides a convenient platform for evaluating the capabilities of the MAX32625/MAX32626 microcontroller. The EV kit also provides a complete, functional system ideal for developing and debugging applications.

EV Kit Contents

- EV kit board with a MAX32625 or MAX32626 microcontroller
- Olimex ARM-USB-TINY-H JTAG debugger with JTAG ribbon cable (for connecting from debugger to EV kit header J1) and USB standard A-to-B cable (for connecting from PC to debugger)
- Standard-A to Micro-B USB cable (for connecting from PC or standalone USB power supply to EV kit USB Micro-B connector CN2) allows connection from PC USB host to the IC's USB device controller peripheral
- Standard-A to Micro-B USB cable (for connecting PC to EV kit USB connector CN1) allows virtual COM port interface to the IC's UART 0 or UART 1 through a USB/UART bridge
- MAX32625/MAX32626 EV Kit Quick Start Guide
- Hex Keys for the Socket (MAX32626 EV Kit Only)

Benefits and Features

- Easily Load and Debug Code Using the Supplied Olimex ARM-USB-TINY-H JTAG Debugger Connected Through a Standard 20-Pin ARM JTAG Header
- Selectable Power Sources for PMIC Include USB Power Through the CN1 or CN2 Connector, Optional External Battery Through J2 Connector, or Bench Supply Through Test Points TP8 and TP9
- Selectable Power Source for On-Board Peripherals (Switches, LEDs, OLED Display, SPI Flash, Bluetooth® LE Transceiver)
- Headers for Accessing the IC's I/O Pins and Analog Front End (AFE) Input Signals
- USB Micro-B Connection to the IC's USB Device Controller
- USB Micro-B Connection to USB-UART Bridge Selectable Between the IC's Internal UART 0 and UART 1
- On-Board Bluetooth 4.0 BLE Transceiver with Chip Antenna
- General-Purpose Pushbutton Switches and Indicator LEDs (All Connected to GPIOs) for User I/O
- Prototyping Matrix (0.1in Grid) with Integrated Power Rails for Customer Circuitry

MAX32625 EV Kit

Ordering Information appears at end of data sheet.

Getting Started

- 1) While observing safe ESD practices, carefully remove the EV kit board out of its packaging. Quickly inspect the board to ensure that no damage occurred during shipment. Jumpers/shunts were preinstalled prior to testing and packaging. By default, the USB-UART bridge is the source of power for the EV kit board. See [Table 1](#) and [Figure 3](#) for the default settings and descriptions.
- 2) The IC is preprogrammed with a demo program. To power up the board and run the demo, simply connect the Micro-USB cable to the Micro-USB jack found at the top left of the EV kit PCB. The jack is labeled CN1. The other end of the Micro-USB cable can be connected either to a computer **or** to a USB wall charger to get +5V power.
- 3) Once power is applied, the demo initiates. The demo displays text and graphics on the OLED display, flashes LED0–LED3, and outputs data to UART0.
- 4) Do not connect any of the additional USB cables or Olimex JTAG adapter until after the tool chain/drivers are installed.

If the demo runs as expected, the next step is to download and run the installer. Refer to the EV kit's quick start guide. The installer is a small application that allows the user to select which components to download and install including tools, drivers, and documentation. A description of each component and the hard drive size required for each can be seen by clicking on each component.

Detailed Description

This section describes each major function or component on the EV kit. This EV kit is general purpose in nature and provides many user-selectable options that are described in the following sections. Each jumper setting is described and its default setting illustrated.

Board Power

The EV kit's main power supply input is +5V, made available through Micro-USB type-B connector CN1 or CN2. The board is default jumpered for power to be provided by CN1.

Current Monitoring

Jumpers JP15, JP16, JP18, and JP19 provide convenient current monitoring points for VDD12 (JP15), VRTC (JP18), VDDDB (JP19), and VDD18 (JP16). VDDIO (JP27) and VDDIOH (JP28) current can be monitored using these source selection jumpers.

Pushbuttons

Pushbuttons (normally open) SW1, SW2, and SW3 can be used to generate a logic 0 signal on their corresponding GPIO port pins. Firmware defines the action taken on switch closure.

Pushbutton SW4 provides a global POR reset function for the IC by asserting the RSTN input.

Pushbutton SW5 controls the PFN1 input of the PMIC. The function of the PFN1 input is configurable but is preset to reset the PMIC when depressed for at least 12 seconds.

USB

The IC provides an integrated USB2.0 full-speed interface (12Mbps). This interface is accessed through the Micro-USB type-B connector, CN2.

USB-UART Bridge

The EV kit board provides a USB-to-UART bridge chip, FTDI FT230X. This bridge eliminates the requirement for a physical RS-232 COM port. Instead, the IC's UART access is through the Micro-USB type-B connector, CN1. Virtual COM port drivers and guides for installing Windows® drivers are available at the FTDI Chip website. Default parameters are 115,200 baud, 8 bits, no parity, 1 stop bit, no flow control.

The USB-to-UART bridge can be connected to UART 0 or UART 1 of the IC with jumpers JP10 (RX), JP12 (TX), JP13 (CTS), and JP14 (RTS). This interface is the default power source for the EV kit.

LEDs

The EV kit board has four LEDs with series current-limiting resistors. LEDs D1 (red), D2 (green), D3 (red), and D4 (green) are connected to the IC's GPIO pins P3.0, P3.1, P3.2, and P3.3, respectively. LED GPIOs must be configured as open-drain due to 3.3V LED source voltages. A LED illuminates when the appropriate GPIO pin is driven low.

Bluetooth Low-Energy (BLE) Controller

The EV kit board has a low-power Bluetooth controller, EM9301. Communication with the IC is through SPIM2. This particular SPI port was selected due to the additional flow control signals that it features. The EM9301 controller is Bluetooth specification V4.0 compliant. Refer to the EM Microelectronic EM9301 data sheet for additional details.

Windows is a registered trademark and service mark of Microsoft Corp

Figure 1. EV Kit Block Diagram

Figure 2. MAX32625 EV Kit Board

Clocking

The IC operates from an internal 96MHz relaxation oscillator. The internal oscillator is adequate to run the core digital logic and peripherals. The accuracy of the internal oscillator is not suitable for accurate RTC timekeeping or USB operation. The external 32.768kHz crystal, Y1, provides the RTC with an accurate time base and is also used to calibrate the internal oscillator for the accuracy required for USB operation.

JTAG Connector

The ARM standard 20-pin connector pinout is provided by shrouded header J1. JH6 is provided as an optional debugging access point, it is not populated by default. The Olimex ARM-USB-TINY-H debugger is supplied with the EV kit. Various debugger modules are available for this interface. See the schematic notes for instructions when using other than supplied debugger. JTAG logic levels are set by VDDIO and are 3.3V tolerant. Refer to the IC's data sheet for more detail.

JTAG Serial Wire Debug (SWD) Support

SWD is supported by the IC and this EV kit. The port shares its clock (SWCLK) with JTAG TCK and a bidirectional data pin (SWDIO) is shared with JTAG TMS.

Graphic OLED Display Module

A 128 x 32 pixel graphic OLED display module, NHD-2.23-12832UCB3, is provided on the EV kit board. Communications with the NHD-2.23-12832UCB3 is through SPIM0.

Power Management IC (PMIC)

The MAX14690 manages the EV kit power rails. It also manages the selection of EV kit power from either VBUS from CN1 or CN2 or an (optional) external lithium-ion polymer battery. The MAX14690 can also function as a battery charger. Refer to the MAX14690 IC data sheet for additional information.

GPIO Headers and Port configuration

The IC provides support for both 1.8V and 3.3V peripherals through power rails VDDIO and VDDIOH. GPIO voltages can be programmed on a port-by-port basis, refer to the IC's user's guide for more detail. Multiple pullup options are supported when using special function port modes, with user selectable pullup voltage options to both rail voltages supported through jumper selection.

Prototyping Area

An area for adding customer-specific circuitry is provided. This matrix is on a 0.1in spacing and is usable for solder or wire-wrap construction. Power and ground rails run through the matrix.

Jumper Descriptions

[Table 1](#) details the functions of the configurable jumper headers on the EV kit board. The headers are standard 0.1in spacing, 0.025in posts. Settings in [Table 1](#) marked with an asterisk (“*”) indicate default placements. [Figure 3](#) also shows the default placements highlighted in red.

Table 1. Jumper Functions and Default Settings

| JUMPER | SIGNAL | SETTINGS | DESCRIPTION |
|--------|--------|----------|---------------------------|
| JP1 | P3_0 | 1-2* | Connects P3_0 to LED0 |
| | | Open | Disconnects LED0 |
| JP2 | P3_1 | 1-2* | Connects P3_1 to LED1 |
| | | Open | Disconnects LED1 |
| JP3 | P3_2 | 1-2* | Connects P3_2 to LED2 |
| | | Open | Disconnects LED2 |
| JP4 | P3_3 | 1-2* | Connects P3_3 to LED3 |
| | | Open | Disconnects LED3 |
| JP5 | AIN0 | 1-2 | Connects AIN0 to BAT |
| | | 2-3 | Connects AIN0 to PMIC_MON |
| JP6 | AIN1 | 1-2 | Connects AIN1 to VBUS |
| | | 2-3 | Connects AIN1 to PMIC_MON |

Table 1. Jumper Functions and Default Settings (continued)

| JUMPER | SIGNAL | SETTINGS | DESCRIPTION |
|--------|----------------------|----------|--|
| JP7 | 1V8 | 1-2* | Connects FLASH VCC to 1V8 power |
| | | Open | Disconnects FLASH VCC |
| JP8 | 3V3 | 1-2* | Connects OLED display to 3V3 power |
| | | Open | Disconnects OLED display |
| JP9 | 3V3 | 1-2* | Connects BTLE to 3V3 power |
| | | Open | Disconnects BTLE |
| JP10 | TXD of USB-SERIAL IC | 1-2* | Connects TXD of USB—Serial IC to P0_0 (UART0A_RX) |
| | | 2-3 | Connects TXD of USB—Serial IC to P2_0 (UART1A_RX) |
| JP11 | — | — | Not applicable |
| JP12 | RXD of USB-SERIAL IC | 1-2* | Connects RXD of USB—Serial IC to P0_1 (UART0A_TX) |
| | | 2-3 | Connects RXD of USB—Serial IC to P2_1 (UART1A_TX) |
| JP13 | RTS of USB-SERIAL IC | 1-2* | Connects RTS of USB—Serial IC to P0_2 (UART0A_CTS) |
| | | 2-3 | Connects RTS of USB—Serial IC to P2_2 (UART1A_CTS) |
| JP14 | CTS of USB-SERIAL IC | 1-2* | Connects CTS of USB—Serial IC to P0_3 (UART0A_RTS) |
| | | 2-3 | Connects CTS of USB—Serial IC to P2_3 (UART1A_RTS) |
| JP15 | VDD12 | 1-2* | Connects VDD12 to the PMIC B1OUT (1V2) |
| | | Open | Disconnects the PMIC B2OUT (1V2) |
| JP16 | VDD18 | 1-2* | Connects VDD18 to the PMIC B1OUT (1V8) |
| | | Open | Disconnects the PMIC B1OUT (1V8) |
| JP17 | L1IN of PMIC | 1-2 | Connects L1IN of the PMIC to BAT (battery) |
| | | 2-3* | Connects L1IN of the PMIC to SYS |
| JP18 | VRTC | 1-2* | Connects VRTC to the PMIC L1OUT (1V8) |
| | | Open | Disconnects the PMIC L1OUT (1V8) |
| JP19 | VDDB | 1-2* | Connects VDDB to the PMIC L2OUT (3V2) |
| | | Open | Disconnects the PMIC L2OUT (3V2) |
| JP20 | IN of the 3V3 LDO | 1-2* | Connects IN of the 3V3 on-board LDO to VBUS |
| | | 2-3 | Connects IN of the 3V3 on-board LDO to SYS |
| JP21 | P3_4 | 1-2 | Connects P3_4 to 1V8 10kΩ pullup |
| | | 2-3 | Connects P3_4 to 3V3 10kΩ pullup |
| JP22 | P3_5 | 1-2 | Connects P3_5 to 1V8 10kΩ pullup |
| | | 2-3 | Connects P3_5 to 3V3 10kΩ pullup |
| JP23 | P1_6 | 1-2 | Connects P1_6 to 1V8 10kΩ pullup |
| | | 2-3 | Connects P1_6 to 3V3 10kΩ pullup |
| JP24 | P1_7 | 1-2 | Connects P1_7 to 1V8 10kΩ pullup |
| | | 2-3 | Connects P1_7 to 3V3 10kΩ pullup |

Table 1. Jumper Functions and Default Settings (continued)

| JUMPER | SIGNAL | SETTINGS | DESCRIPTION |
|--------|-------------------|----------|---|
| JP25 | 1V8 | 1-2* | Connects 1V8 to PMIC B2OUT (1V8) |
| | | 2-3 | Connects 1V8 to 1V8 on-board LDO |
| JP26 | IN of the 1V8 LDO | 1-2* | Connects IN of the 1V8 on-board LDO to VBUS |
| | | 2-3 | Connects IN of the 1V8 on-board LDO to SYS |
| JP27 | VDDIO | 1-2* | Connects VDDIO to 1V8 |
| | | 2-3 | Connects VDDIO to 3V3 |
| JP28 | VDDIOH | 1-2* | Connects VDDIOH to 3V3 |
| | | 2-3 | Connects VDDIOH to VDDIO |
| JP29 | USB_VBUS | 1-2* | Connects USB_VBUS to USB-UARTS (CN1) |
| | | 2-3 | Connects USB_VBUS to USB (CN2) |
| JP30 | 3V3 | 1-2 | Connects 3V3 to PMIC L3OUT (3V0) |
| | | 2-3* | Connects 3V3 to 3V3 on-board LDO |

*Default position.

MAX32625/MAX32626 Schematics

NOTES:

REV 2.0

- 1) Changed GPIO4_1 to GPIO4_0 because Bluetooth uses GPIO2_7 for its SPIM2 Slave Select and GPIO4_0 is SPIM2 cooresponding Slave Ready signal.
Changed the net names to BTLE_SR0 and BTLE_SSEL2_0.
