

Tiny Package, High Efficiency, Step-up DC/DC Converter

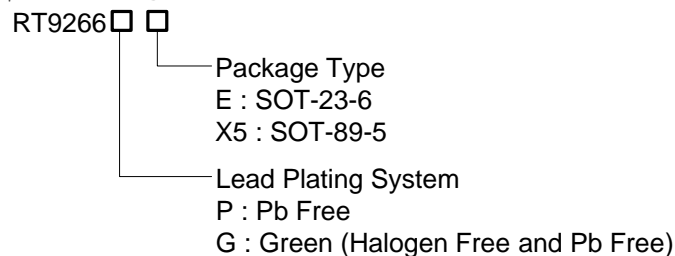

General Description

The RT9266 is a compact, high efficiency, and low voltage step-up DC/DC converter with an Adaptive Current Mode PWM control loop, includes an error amplifier, ramp generator, comparator, switch pass element and driver in which providing a stable and high efficient operation over a wide range of load currents. It operates in stable waveforms without external compensation.

The low start-up input voltage below 1V makes RT9266 suitable for 1 to 4 battery cells applications of providing up to 300mA output current. The 450kHz high switching rate minimized the size of external components. Besides, the 17µA low quiescent current together with high efficiency maintains long battery lifetime.

The output voltage is set with two external resistors. Both internal 2A switch and driver for driving external power devices (NMOS or NPN) are provided.

Ordering Information

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

Marking Information

For marking information, contact our sales representative directly or through a Richtek distributor located in your area.

Features

- 1.0V Low Start-up Input Voltage
- High Supply Capability to Deliver 3.3V 100mA with 1 Alkaline Cell
- 17µA Quiescent (Switch-off) Supply Current
- Zero Shutdown Mode Supply Current
- 90% Efficiency
- 450kHz Fixed Switching Frequency
- Providing Flexibility for Using Internal and External Power Switches
- Small SOT-23-6 & SOT-89-5 Package
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- PDA
- DSC
- LCD Panel
- RF-Tags
- MP3
- Portable Instrument
- Wireless Equipment

Functional Pin Description

Pin No.		Pin Name	Pin Function
SOT-23-6	SOT-89-5		
1	1	EN	Chip Enable (Active High).
2	--	EXT	Output Pin for Driving External N-MOSFET.
3	5	GND	Ground.
4	4	LX	Pin for Switching.
5	2	VDD	Input Positive Power Pin of RT9266.
6	3	FB	Feedback Input Pin. Internal Reference Voltage for the Error Amplifier is 1.25V.

Absolute Maximum Ratings

- Supply Voltage ----- -0.3V to 7V
- LX Pin Switch Voltage ----- -0.3V to 7V
- Other I/O Pin Voltages ----- -0.3V to (V_{DD} + 0.3V)
- LX Pin Switch Current ----- 2.5A
- EXT Pin Driver Current ----- 200mA
- Package Thermal Resistance
 - SOT-23-6, θ_{JC} ----- 145°C/W
 - SOT-89-5, θ_{JC} ----- 45°C/W
- Operating Junction Temperature ----- 125°C
- Storage Temperature Range ----- -65°C to +150°C

NOTE:

Absolute Maximum ratings are threshold limit values that must not be exceeded even for an instant under any conditions. Moreover, such values for any two items must not be reached simultaneously. Operation above these absolute maximum ratings may cause degradation or permanent damage to the device. These are stress ratings only and do not necessarily imply functional operation below these limits

Recommended Operating Conditions (1)

- Junction Temperature Range ----- -40°C to 125°C
- Ambient Temperature Range ----- -40°C to 85°C

Note :

- (1). The device is not guaranteed to function outside its operating conditions.
- (2). No Load Current is highly dependent on practical system design and component selection that cannot be covered by production testing. Typical No Load Current is verified by typical application circuit with recommended components. No Load Current performance is guaranteed by Switch Off Current and Continuous Switching Current.
- (3). Current Limit is guaranteed by design at $T_A = 25^\circ C$.
- (4). Load Regulation is not tested at production due to practical instrument limitation. Load Regulation performance is dominantly dependent on DC loop gain and LX ON Resistance that are guaranteed by "Line Regulation" and "LX ON Resistance" tests in production.

Application Information

Output Voltage Setting

Referring to Typical Application Circuits, the output voltage of the switching regulator (V_{OUT}) can be set with Equation (1).

$$V_{OUT} = \left(1 + \frac{R1}{R2}\right) \times 1.25V \quad (1)$$

Feedback Loop Design

Referring to Typical Application Circuits. The selection of R1 and R2 based on the trade-off between quiescent current consumption and interference immunity is stated below:

- Follow Equation (1)
- Higher R reduces the quiescent current (Path current = $1.25V/R2$), however resistors beyond $5M\Omega$ are not recommended.
- Lower R gives better noise immunity, and is less sensitive to interference, layout parasitics, FB node leakage, and improper probing to FB pins.

- A proper value of feed forward capacitor parallel with R1 can improve the noise immunity of the feedback loops, especially in an improper layout. An empirical suggestion is around $0\sim 33pF$ for feedback resistors of $M\Omega$, and $10nF\sim 0.1\mu F$ for feedback resistors of tens to hundreds $k\Omega$.

For applications without standby or suspend modes, lower values of R1 and R2 are preferred. For applications concerning the current consumption in standby or suspend modes, the higher values of R1 and R2 are needed. Such “high impedance feedback loops” are sensitive to any interference, which require careful layout and avoid any interference, e.g. probing to FB pin.

Layout Guide

- A full GND plane without gap break.
- V_{DD} to GND noise bypass – Short and wide connection for the $1\mu F$ MLCC capacitor between Pin5 and Pin3.
- V_{IN} to GND noise bypass – Add a capacitor close to L1 inductor, when V_{IN} is not an idea voltage source.
- Minimized FB node copper area and keep far away from noise sources.
- Minimized parasitic capacitance connecting to LX and EXT nodes, which may cause additional switching loss.
