BASICS

- **Addressing**
 - » Example
 - » Address area
 - BSLIN
 - BSLOUT
 - **Configuring the address zone to pilot MTP**
 - » Internal address area (MTP)
 - » External address area (M3)
 - Details of the area used by M3

Definitions:

SLIn = Serial Link In →

Function block that allows M3 to read 8 words by using the M3 programming port.

3 blocks with 8 words each can be used (addresses 1-8, 9-16, 17-24)

SLIn S →

Same as SLIn but saves values at power failure.

(Use either SLIn or SLIn S in a program, do not mix both types)

SLOut = Serial Link Out →

Function block that allows M3 to write 8 words by using the M3 programming port.

3 blocks with 8 words each can be used (addresses 25-32, 33-40, 41-48)

M3 → **Millenium3**

MTP = Millenium Touch Panel → Screen of the M3

MTPWIN → Programming software of the MTP01

WSLIN → Word address in MTPWIN related to an SLIn function block

WSLOUT → Word address in MTPWIN related to an SLOut function block

BSLIN → Bit address in MTPWIN related to an SLIn function block

BSLOUT → Bit address in MTPWIN related to an SLOut function block

Addressing

Words and Bits are used for the data exchange between MTP01 and M3.

Word address area:

Millenium3: SLIn 1 - 24 => MTPWIN: WSLIN 1 - 24

Millenium3: SLOut 25 - 48 => MTPWIN : WSLOUT 25 - 48

Word addressing example

M3: SLIn4 ⇒ MTPWIN: WSLIN4

Reference Device

WSLIN4

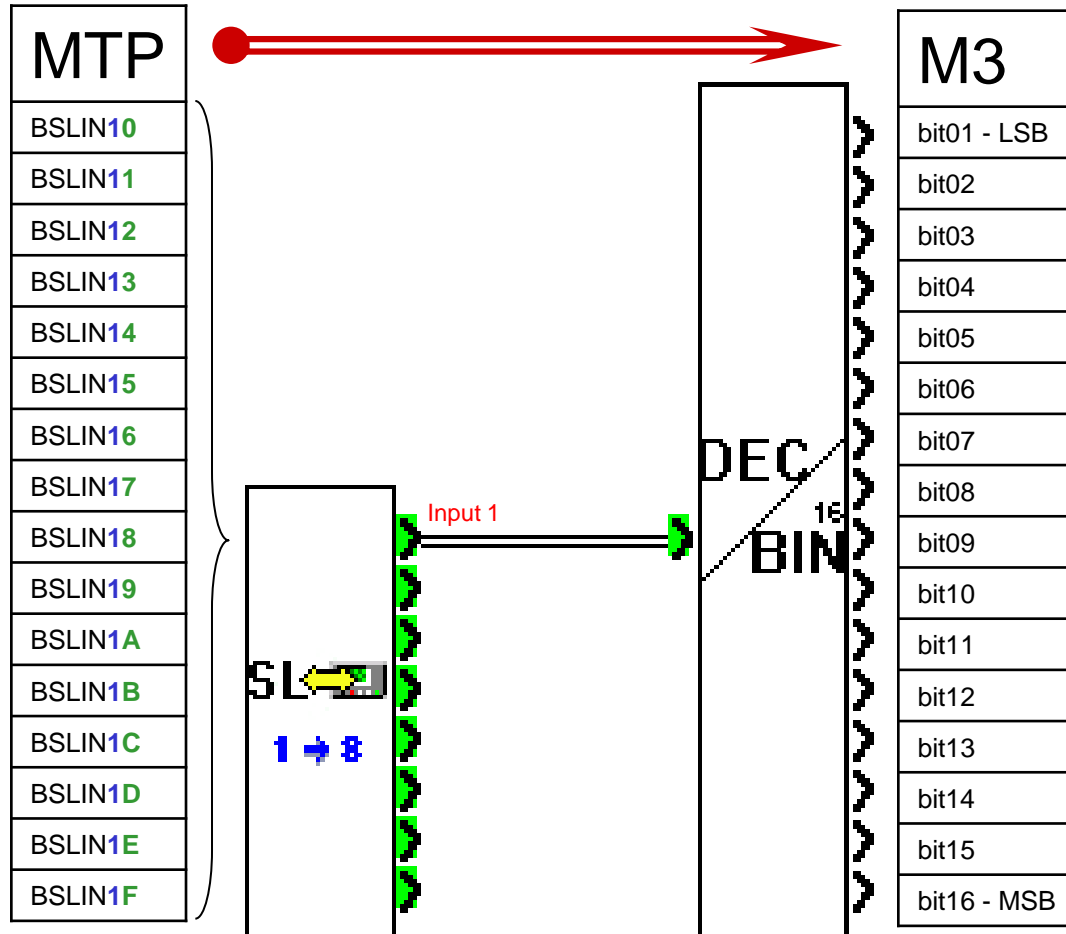

M3: SLOut31 ⇒ MTPWIN: WSLOUT31

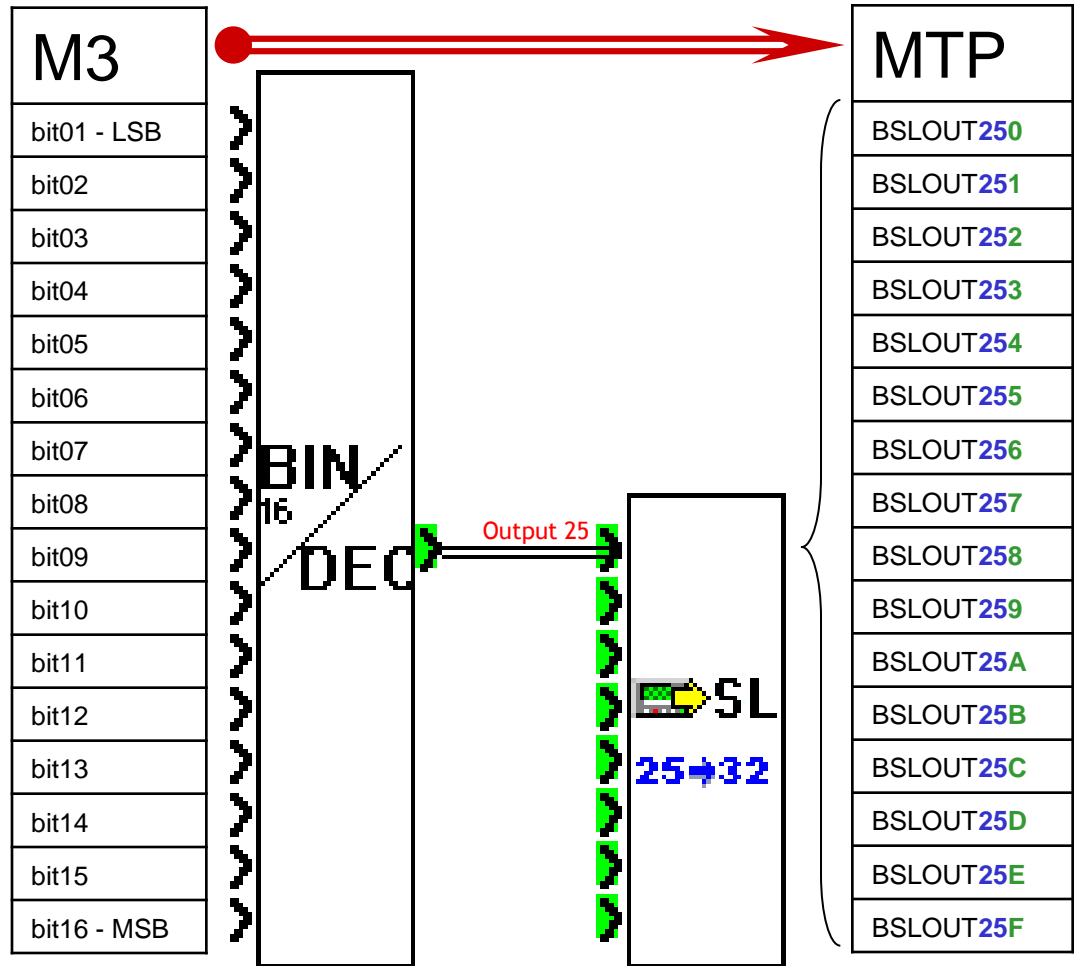

Reference Device

WSLOUT31

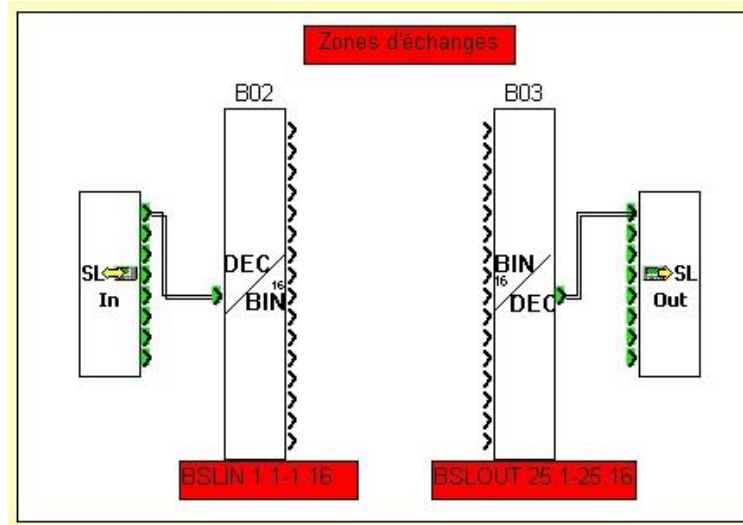

Addressing a bit - BSLIN

Addressing a bit - BSLOUT

Addressing bits in M3 is done with these function blocks:

How to address a bit in MTPWIN:

The bits (BLSOUT or BSLIN) are described like this: **N word + N°bit**

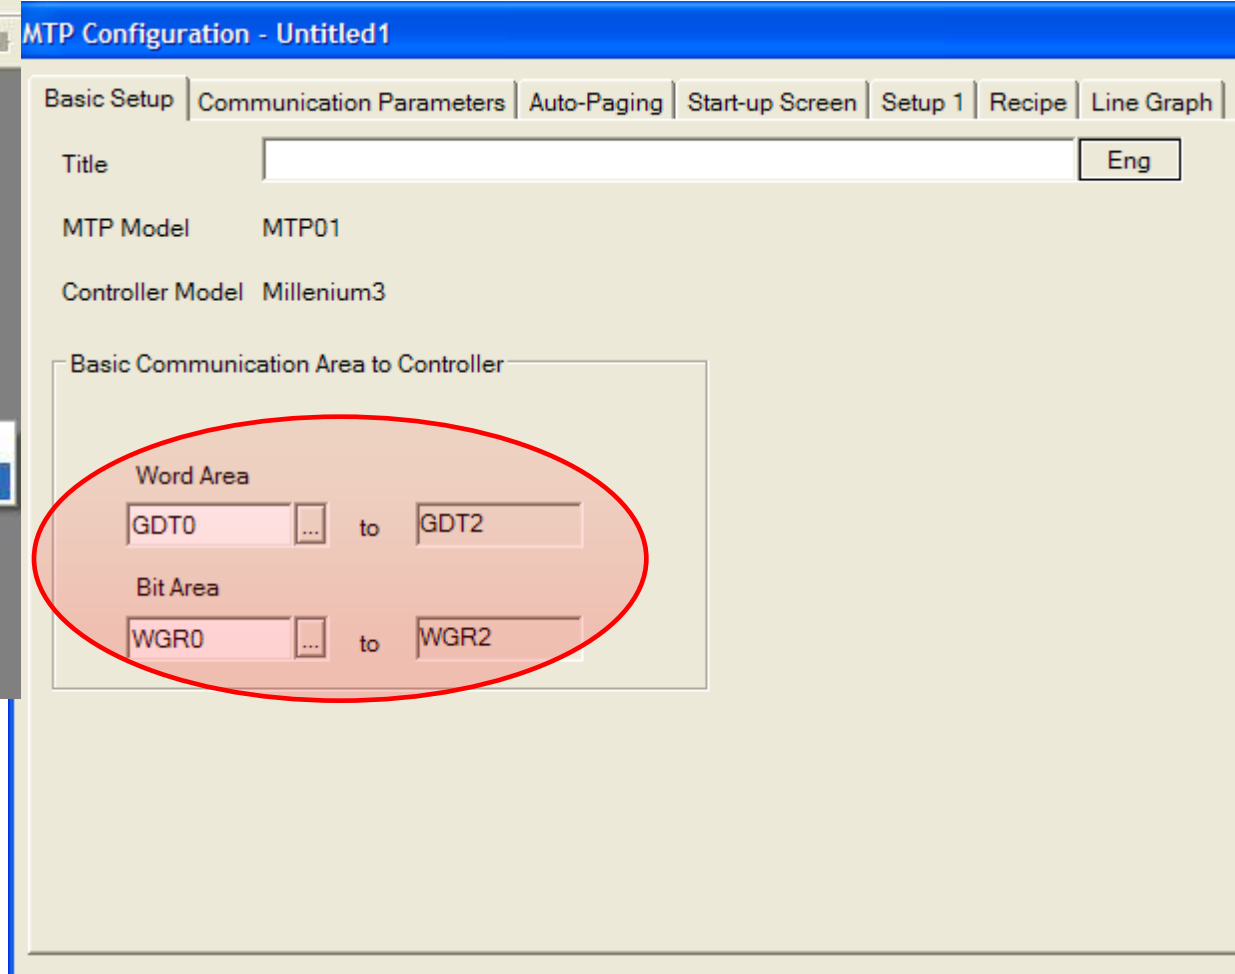

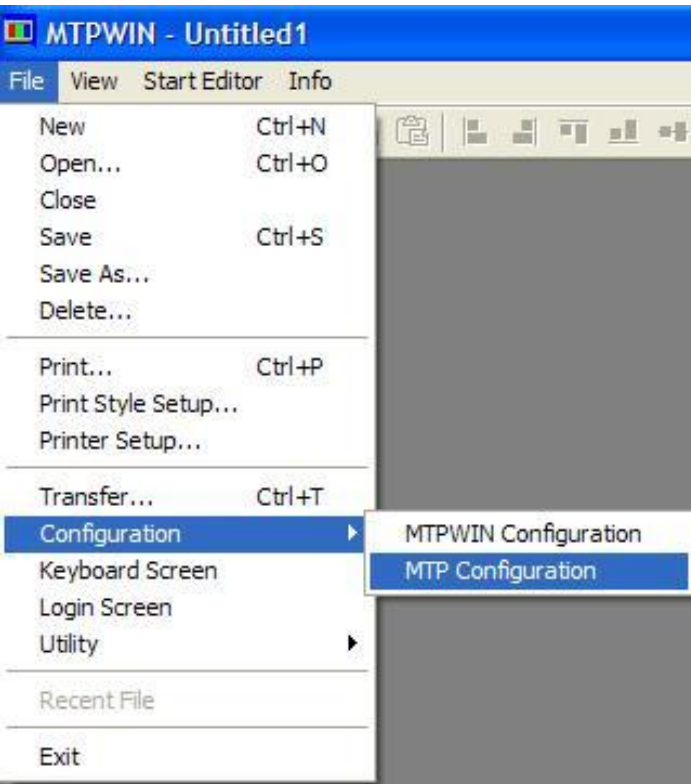

Example: To work with bit 15 on SLOut12, it will be noted as **BSLOUT12E**.

The address area ranges from 1 to 48 and is defined as follows:

Bit SLIn 1.1 - 24.16 of M3 ⇒ BSLIN **10** to **24F** in the MTPWIN

Bit SLOut 25.1 - 48.16 of M3 ⇒ BSLOUT **250** to **48F** in the MTPWIN

Basic communication Area to PLC (M3): Internal addresses reserved to pilot the MTP01

Internal pilot area (MTP01):

N ex: GDT0	Change screen (hexadécimal)
N+1 ex: GDT1	Not used
N+2 ex:GDT2	Number of the screen actually in use (hexadécimal)

Position	F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

- Read / write word

• Read / write word

Here one enters the part number of the keyboard that has been placed on the screen.

(Or, if there are several, the keyboard that is to be linked to the data entry.)

• Recipe management

- Control area
- Read/write word
- Read/write bit

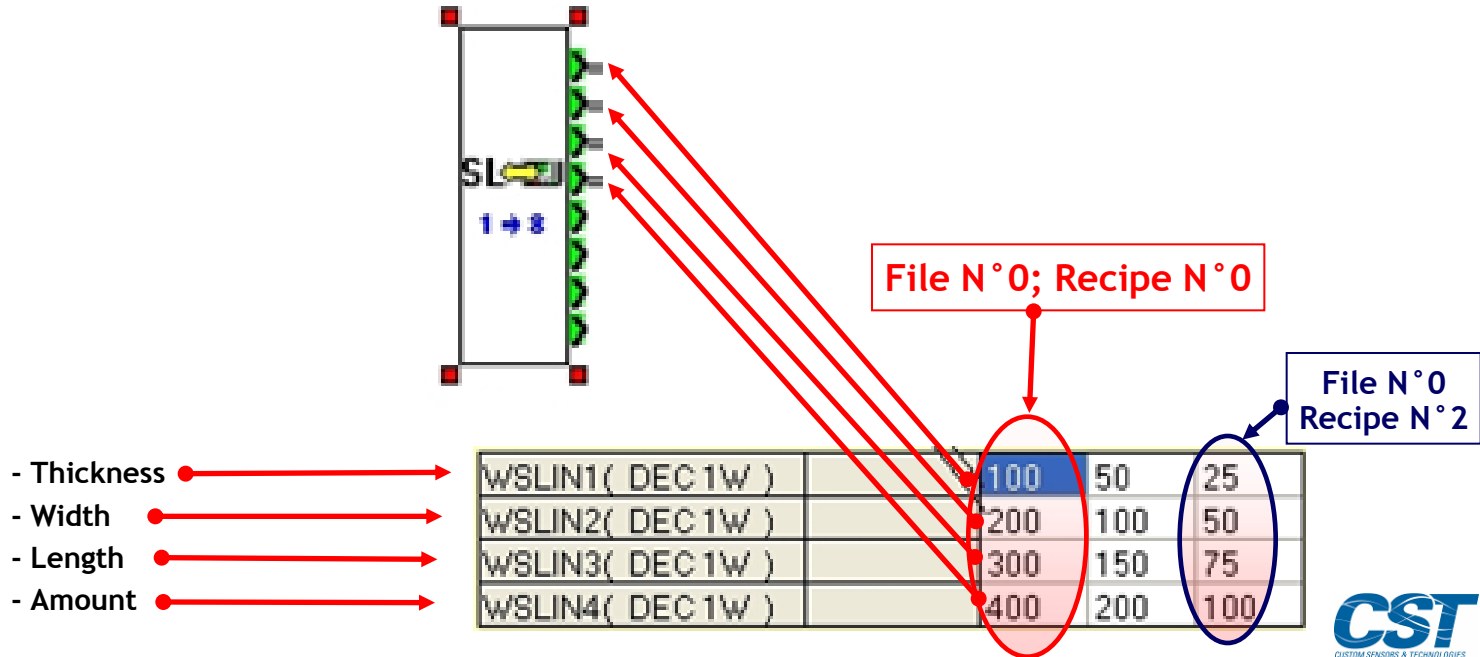

A recipe is a group of parameters that belong together.

Description of a recipe: A machine produces parts with different dimensions in different amounts. The parameters and amounts for each part, called recipes, are sent to Millenium3 by the MTP01 when a new production batch is started.

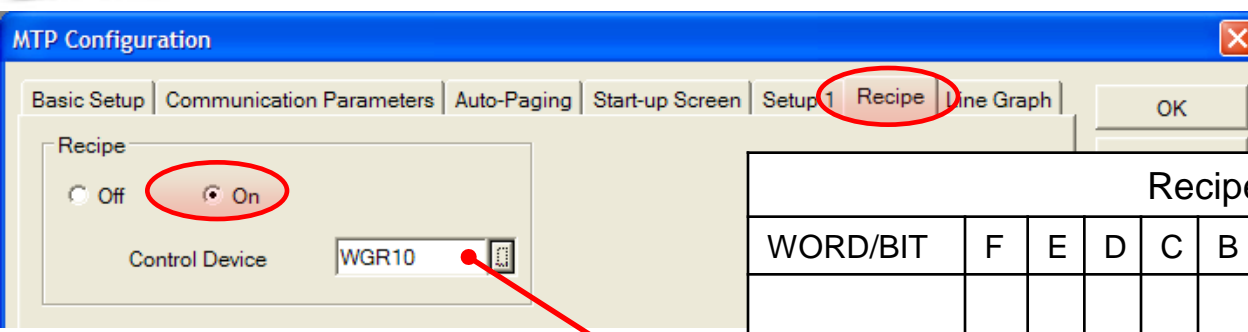

An example: - Thickness

- Width
- Length
- Number of pieces

All parameters should be sent simultaneously to Millenium3. By using MTP01 one can imagine to have several recipes (parameter groups). One can create an Excel table which can be imported by the MTPWIN software, allowing to transfer these recipes (parameter groups) to the MTP01 screen and from there to Millenium3.

The M3 pilot area, adjustable:

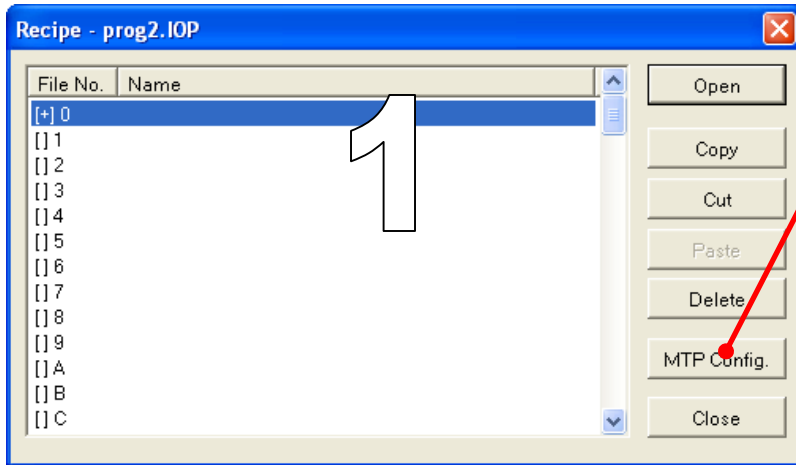

Recipe management

[MTP01_ScreenControl.IOP](#)

• REMINDERS

Changing a page

To control the MTP05 with the keys, in- or outputs of M3 one has to use SLOut function blocks.

Parameters in the M3 program:

Buzzer activation, changing the backlight color or flashing is done on word SLOut47, bits 11,12,13,14 and 16.

To realise switching a screen page use word SLOut45.

The block SLIn17-24 must be present in the M3 program.

Reminder page 19

• Page management using M3.

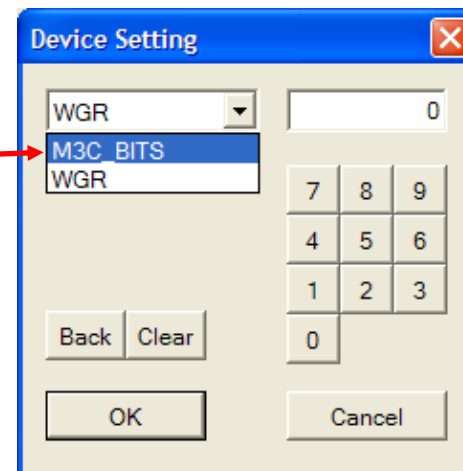

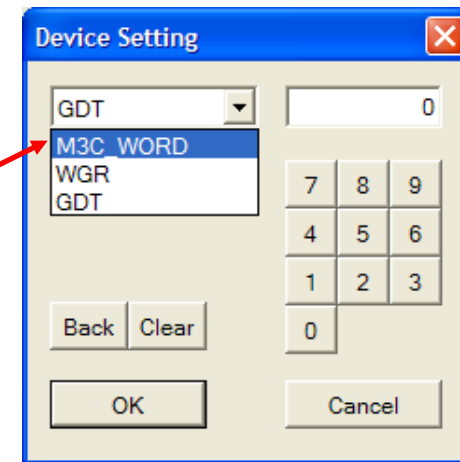

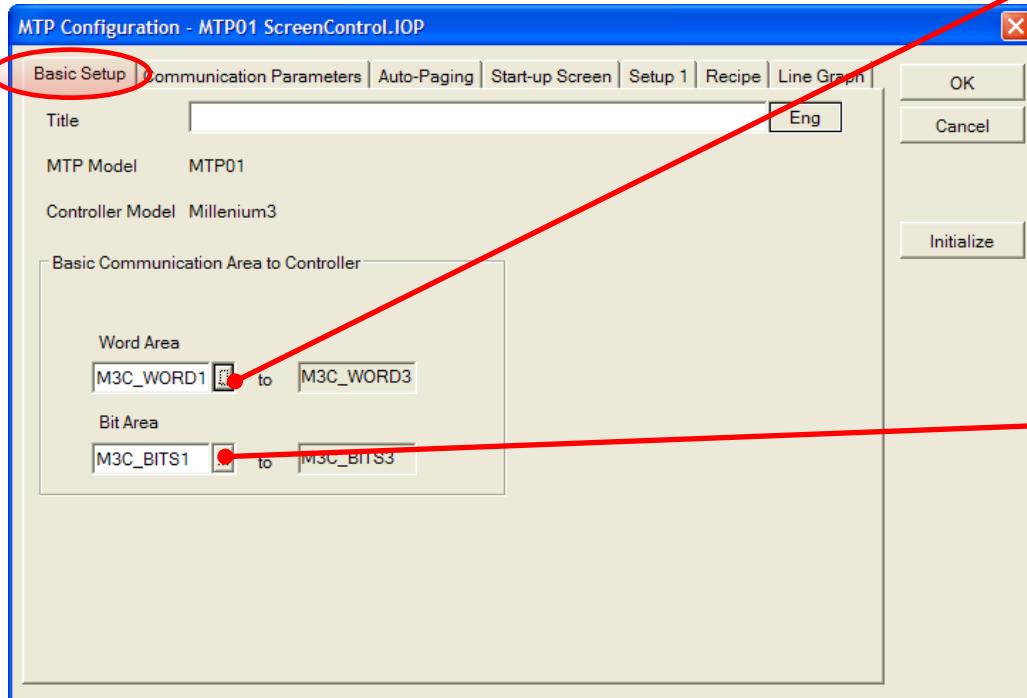

Buzzer activation using the M3 keys.

Managing the backlight color of MTP01 using the M3 keys.

Activate the flashing backlight using the M3 keys.

To be able to do this :

1. Go to: File ⇒ Configuration ⇒ MTP Configuration
2. Configure the 'Basic Communication Area' as shown

- **Read/write M3 parameters**

- Read status
- Read/write M3 clock

- **Status M3, Clock M3**
- **Program description:**
- **Read M3 status by MTP01.**
- **Read/write M3 clock**

Links :

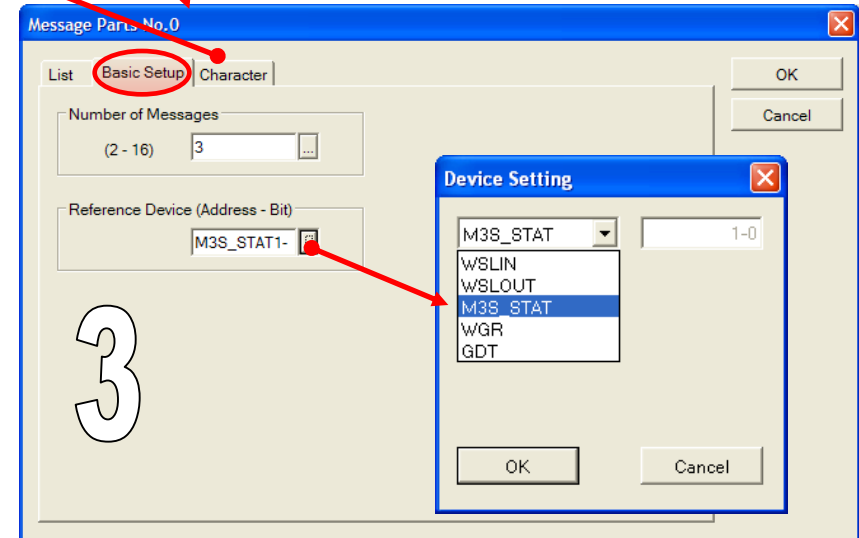

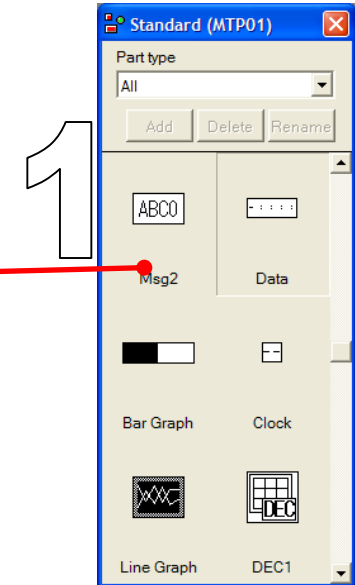

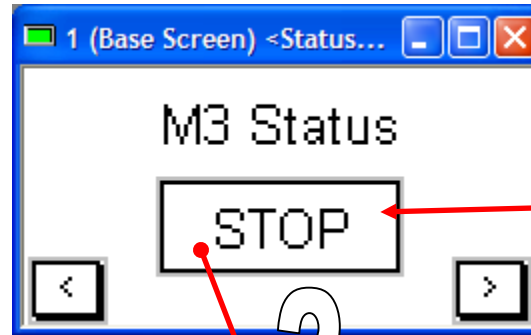

[S_C_Base.pm3](#)

[Status_Clock.IOP](#)

Read M3 status

Reading the status is used to see if M3 is running, has stopped or shows an error.

- Bargraph
- Program description:
- Create a bargraph using values from M3.

Links :

[Bargraph.pm3](#)

[Bargraph.IOP](#)

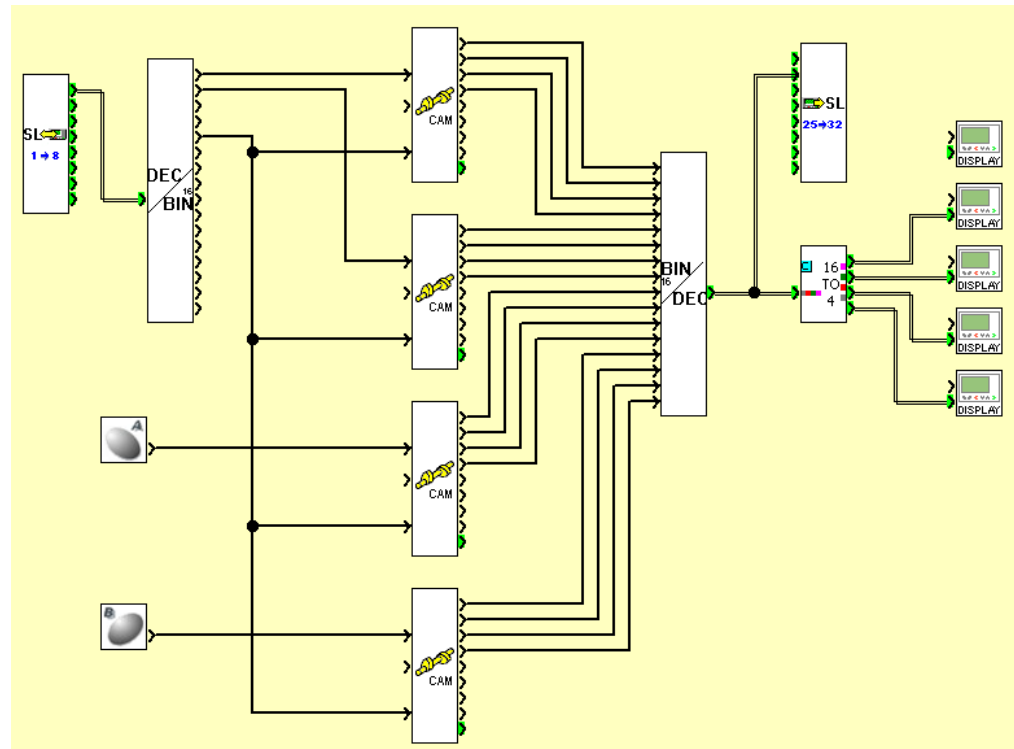

• Bargraph

The image illustrates the configuration of a Bargraph in the MTPWIN software. It consists of three main windows:

- Base Screen (Top):** Shows a screen layout with a 'Start' button, a circular icon, and a Bargraph icon. A red arrow points from the Bargraph icon to the configuration dialog.
- Bar Graph Parts No.0 (Middle):** The 'Basic Setup' tab is active. It shows:
 - Reference Device: WSLOUT25
 - Data Format: DEC 1W Unsigned (marked with a large '1')
 - Graph Type: Direction set to 'Up' (circled in red).
 - Max/Min: 'Max.' is set to 'Fixed (1 - 65535)' with a value of 100. 'Min.' is set to 'Fixed (0 - 65534)' with a value of 0. Both 'Max/Min.' and 'Up' are circled in red.
- Bar Graph Parts No.0 (Bottom):** The 'Display Numeric' tab is active. It shows:
 - Display %: 'On' (circled in red).
 - Color: 'Numeric' is set to black and 'Background' is white.
 - Size: 'Half' is selected.A large '2' is placed next to the 'Display %' section. A red arrow points from the 'Display Numeric' tab back to the 'Base Screen'.

- **Other functions** 
- **Example programs**
 - **Messages**
 - **Bitmaps**
 - **Scrolling messages**
- **Comparator**

- Messages
- Program description:
- Display different messages using one SLOut address.

Links :

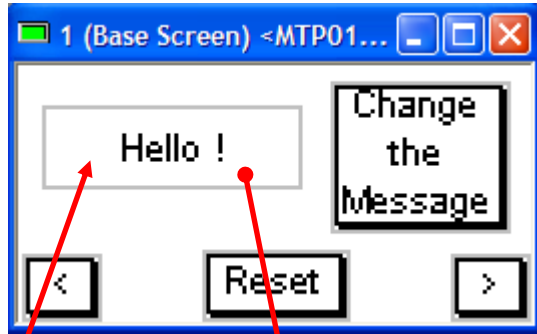

[Message_Base.pm3](#)

[MTP01_Messages.IOP](#)

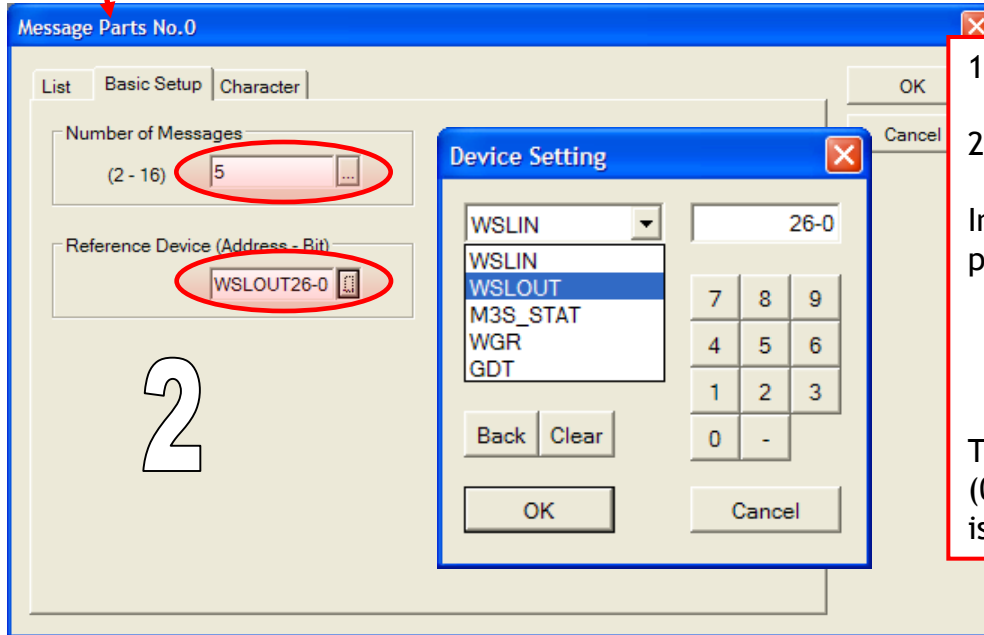

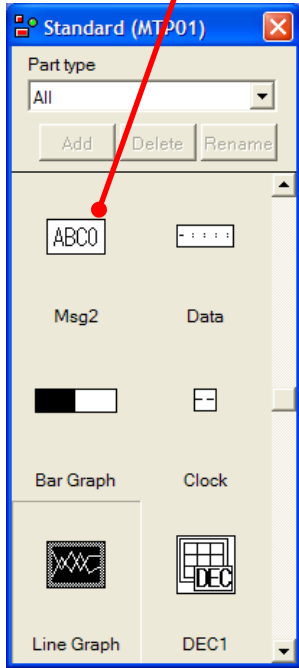

• Messages 1

How the Message parts work:

- The Message part automatically splits up a 16bit word address into four 4bit sub addresses.
- Each of these 'sub addresses' allows to show up to 16 different text messages.
- So using one SLOut address it is possible to display up to 64 different process informations.

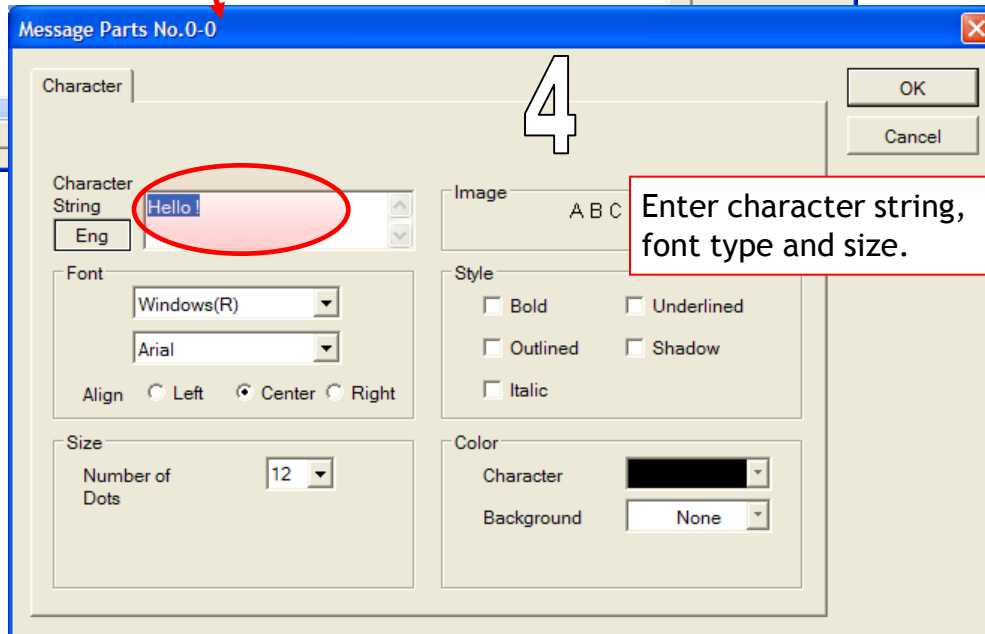

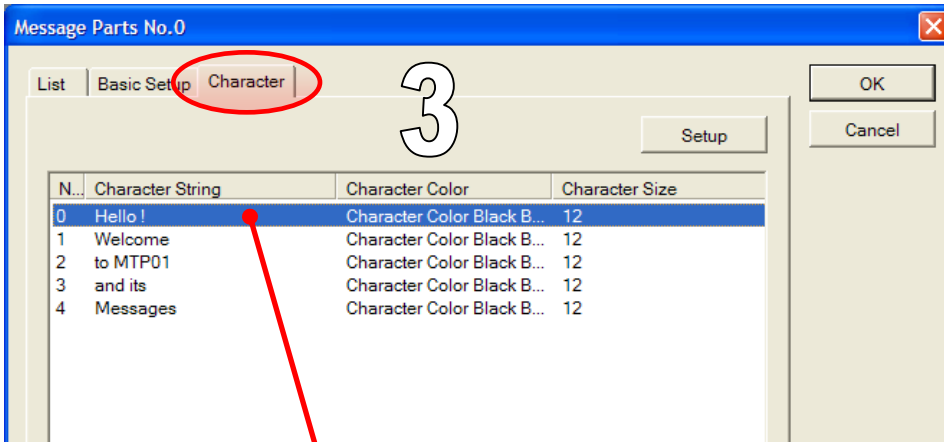

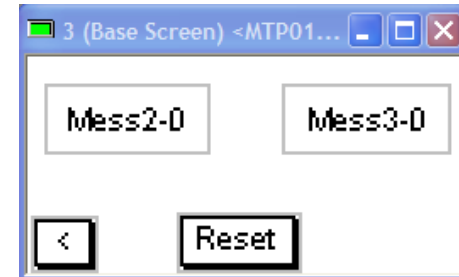

1

2

1. Define the number of messages to be displayed.
 2. Define the 'sub address' which is to be used.
- In the example on SLOut26 the possible settings are:
- 26-0
 - 26-1
 - 26-2
 - 26-3.
- The number of the message (0,1, 2,...) defines which value is needed to activate it.

• Messages 2

Words (values) are used in the communication between M3 and MTP.

So in order to activate a specific message, M3 has to send the value linked to this message.

There are several possibilities to realise this.

- Create a program similar to the example below.
- Use the example below to define the value necessary for a specific message. Write this value to an SLOut when the message needs to be displayed.
- Use the example as a base to create a table for the FBD_C (Application Specific Function Block) 'Y=f(x)'.
Input = page number to be displayed, output = appropriate value.

Link :

Message_Cam3

- **Bitmap and scrolling messages**
- Program description:
- Insert a bitmap image
- Show scrolling messages

The scrolling messages are shown on all screens and are therefore not configurable per screen.

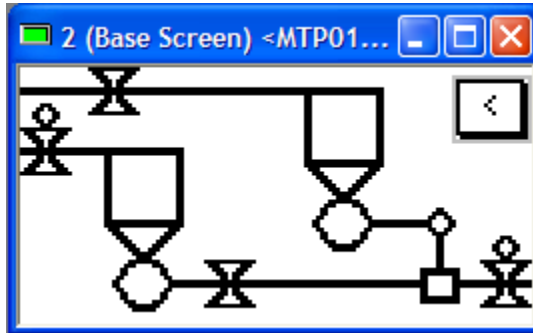

Link :

MTP01_Bitmap.IOP

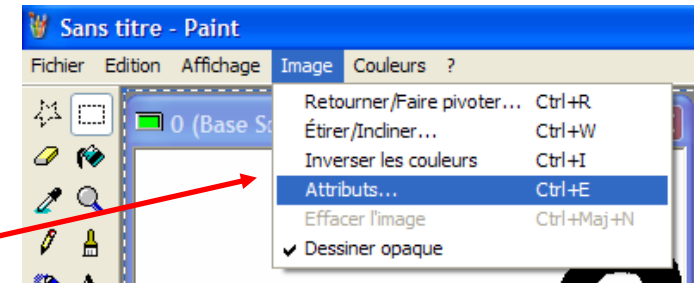

• Bitmap 1

max. size 128 x 64 dots

How to create a Bitmap:

1. Draw the schematics of ones application using powerpoint, etc., (or directly in the MTPWIN software) or copy any picture / diagram into PowerPoint, redimension it, tick right, 'save as image', .bmp.
2. To verify the size, copy to Paint, tick 'Image', 'Attributes', or move the mouse over the saved image to activate the pop-up.
3. Copy and paste it into an empty MTP01 screen, or enter it into the MTPWIN Bitmap Library.

Black and white diagrams and pictures produce the best results.

• Bitmap 2

max. size 128 x 64 dots

Go to: Start Editor ⇒ Bitmap

Creating a bitmap

The screenshot shows the MTPWIN Bitmap Editor interface with three numbered steps:

- 1**: A dialog box titled "Read BMP File" is open, showing a list of files. Item 4, "(Does Not Exist)", is selected. A red arrow points from this step to a text box.
- 2**: The "File" menu is open, and "Import BMP File..." is highlighted with a red circle.
- 3**: The "Option" menu is open, and "Change Size..." is highlighted with a red circle.

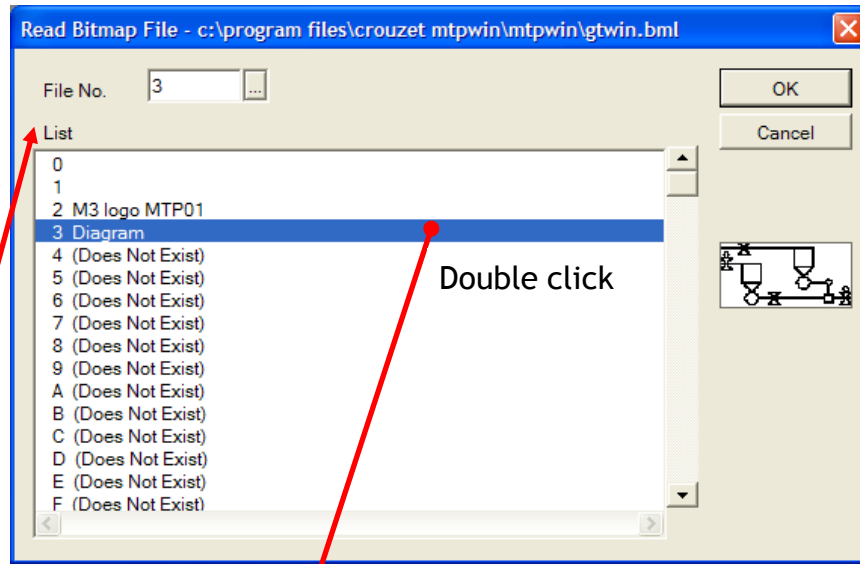

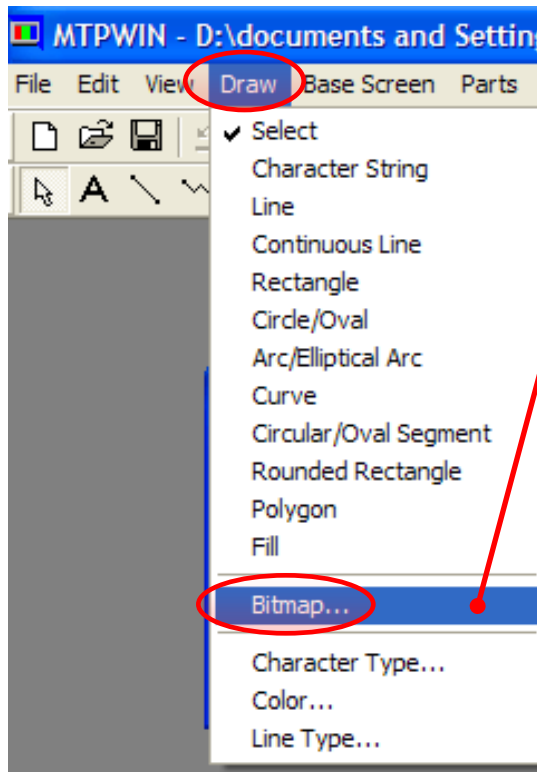

At the bottom of the main window, the status bar reads "Read the bitmap file." and "NUM".

Create your own library of images, and you can use them in any program you make.

• Comparator 2

Write Device video

Write Device flash

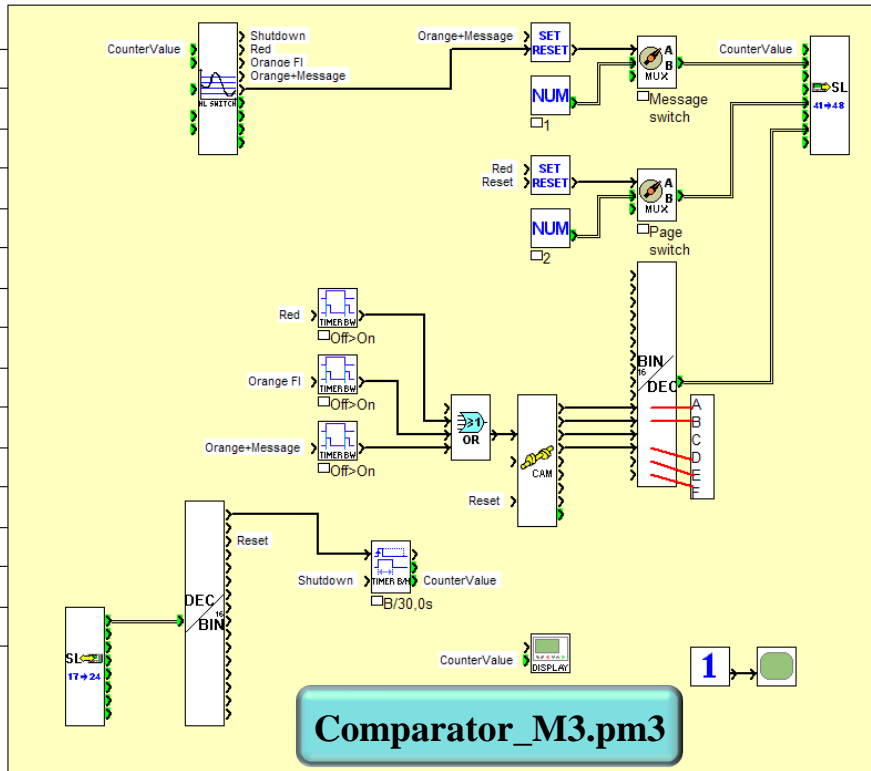

• Comparator 3

The advantage of using 'Write Device':

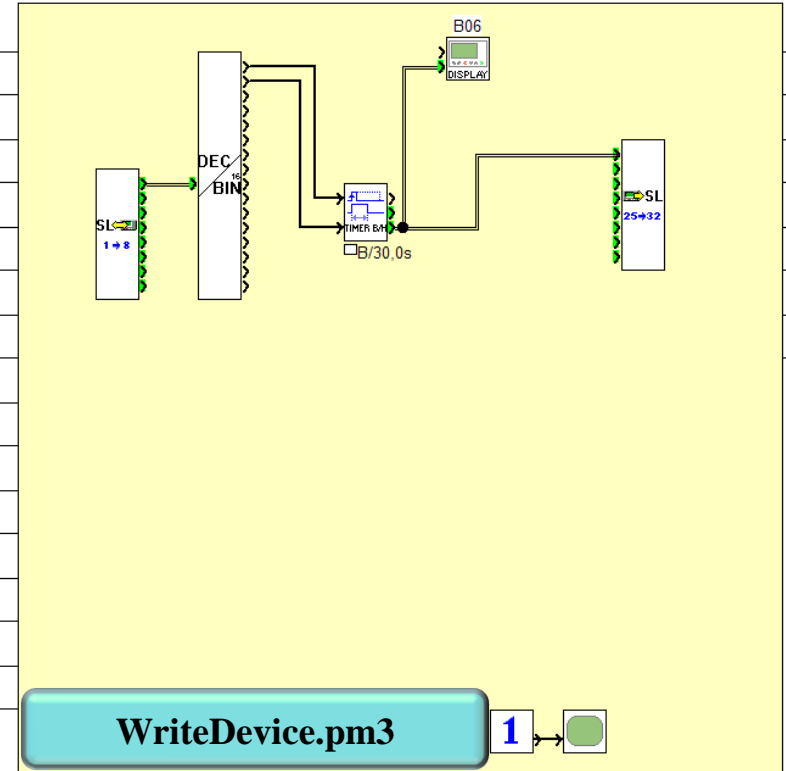

The program 'Comparator_M3.pm3' together with 'Comparator_M3.IOP' has the same functionality, as 'WriteDevice.pm3' in connection with 'MTP01_Write_Device.IOP'.

In case of 'WriteDevice' the M3 program is smaller, because the functions of switching Messages, pages, and colour, and the complete value comparison has been transferred to the Write Device of the MTP.

Comparator_M3.IOP

• Glossary

- Bit ⇒ logic status (1 or 0)
- Word ⇒ a 16 bit value
- WGR ⇒ internal MTP register (Word)
- GDT ⇒ internal MTP register (Word)
- GR ⇒ internal MTP register (Bit)
- WSLOUT ⇒ word/address on block SLOut M3
- WSLIN ⇒ word/address on block SLIn M3
- BSLOUT ⇒ bit of a word on block SLOut M3
- BSLIN ⇒ bit of a word on block SLIn M3
- M3 ⇒ Millenium3
- MTPxx ⇒ Millenium Touch Panel (screen of the M3)
- .pm3 ⇒ program written with the M3 software
- .IOP ⇒ program written with the MTPWIN software
